

The Dangers of Excessive Childhood Vaccinations

By Russell L. Blaylock, M.D.

In 1976, children received 10 vaccines before attending school. Today they will receive over 36 injections. The American Academy of Pediatrics and the Center for Disease Control assured parents that it was safe to not only give these vaccines, but that they could be given at one time with complete safety.

Is this true? Or are we being lied to on a grand scale?

The medical establishment has created a set of terms, which they use constantly to boost their egos and firm up their authority as the unique holders of medical wisdom -- the mantra is “**evidence-based medicine**”, as if everything outside their anointing touch is bogus and suspect.

A careful examination of many of the accepted treatments reveals that most have little or no scientific “evidence-based” data to support it. One often repeated study found that almost 80 percent of medical practice had no scientific backing.

I find it interesting that there exist an incredible double standard when it comes to our evidence versus theirs. The proponents of vaccination safety can just say they are safe, without any supporting evidence what-so-ever, and it is to be accepted without question.

Yet, let me, or anyone else, suggest that excessive vaccination can increase the risk of not only autism, but also schizophrenia and neurodegenerative diseases, and they will scream like banshees – *Where is the evidence? Where is the evidence?*

When we produce study after study, they always proclaim them to be insufficient evidence or unacceptable studies.

More often than not, they just completely ignore the evidence. This is despite the fact that we produce dozens or even hundreds of studies that not only demonstrate the link clinically and scientifically, but also clearly show the mechanism by which the damage is being done -- even on a molecular level. These include cell culture studies, mixed cell cultures, organotypic tissue studies, *in vivo* animal studies using multiple species and even human studies. To the defenders of vaccine safety -- our evidence is never sufficient and, if we face reality -- never will be.

The Autism Disaster: Is it Man Made?

In the early 1980s, the incidence of autism was 1 in 10,000 births. By 2005, the incidence had leaped to 1 in 250 births, and today it is 1 in 150 births and still climbing.

One of the strongest links to this terrible set of disorders was a drastic change in the vaccine programs of the United States and many other countries, which included a dramatic increase in the number of vaccines being given at a very early age. No other explanation has been forthcoming from the medical elite.

In this paper I shall present evidence, some of which has not been adequately discussed, that provides a connection between excessive vaccination and neurodevelopmental disorders.

I urge you to read Dr. Blaylock's full-length article, [The Danger of Excessive Vaccination During Brain Development: The Case for a Link to Autism Spectrum Disorders](#),
